

Lenzyme Septic Kit

Treatment Procedures:

- ① Use the 2 bottles of our oxidizer to treat the normal sized drainfield. It will balance the bio-mat and also breakdown the sulfides (black slime) found in most slow running drainfields. In addition, other solids causing problems within the drainfield such as grease through oxidization will be exposed and available for biological treatment. The oxidizer works fast and will produce quick results.
- ② Use the large bottle of the Drainfield Biological Activator to treat the septic tank and drainfield. It is best to apply the Activator into the septic tank to supercharge the biological activity within the septic tank first. This will also supercharge the drainfield with beneficial biological activity as the water flows out of the septic tank and into the drainfield.
- ③ Use the pre-measured packets to treat your entire septic system and home drain lines on a monthly treatment schedule. This will help keep a high level of biological activity going throughout the entire system. Really troublesome systems should be treated on a bi-monthly basis.

Recommended Practice:

It is a good idea to use this kit on a Bi-Annual basis as a recommended prevention practice. Please use your septic professional to do this service. By applying these treatments ever 2 years you are taking action to maintain your whole septic system. This will help you avoid messy and costly repairs or replacement. You want a healthy and properly working septic system, so it will last a very long time!
